Gauss's Law

- 1. Derive an expression for the electric field above an infinite charge sheet.
- 2. Derive an expression for the electric field outside a charged spherical shell of radius R.
- 3. Derive an expression for the electric field inside a uniformly charged sphere of radius R.
- 4. What is the electric field inside a charged spherical shell of radius R?

60 The chocolate crumb mystery. Explosions ignited by electrostatic discharges (sparks) constitute a serious danger in facilities handling grain or powder. Such an explosion occurred in chocolate crumb powder at a biscuit factory in the 1970s. Workers usually emptied newly delivered sacks of the powder into a loading bin, from which it was blown through electrically grounded plastic pipes to a silo for storage. Somewhere along this route, two conditions for an explosion were met: (1) The magnitude of an electric field became 3.0×10^6 N/C or greater, so that electrical breakdown and thus sparking could occur. (2) The energy of a spark was 150 mJ or greater so that it could ignite the powder explosively. Let us check for the first condition in the powder flow through the plastic pipes.

Suppose a stream of *negatively* charged powder was blown through a cylindrical pipe of radius R = 5.0 cm. Assume that the powder and its charge were spread uniformly through the pipe with a volume charge density ρ . (a) Using Gauss' law, find an expression for the magnitude of the electric field \vec{E} in the pipe as a function of radial distance r from the pipe center. (b) Does E increase or decrease with increasing r? (c) Is \vec{E} directed radially inward or outward? (d) For $\rho = 1.1 \times 10^{-3}$ C/m³ (a typical value at the factory), find the maximum E and determine where that maximum field occurs. (e) Could sparking occur, and if so, where? (The story continues with Problem 70 in Chapter 24.)

oostive volume charge density $\rho = A/r$, where A is a constant and r is the distance from the center of the shell. In addition, a small ball of charge q = 45.0 fC is located at that center. What value should A have if the electric field in the shell $(a \le r \le b)$ is to be uniform?

••52 Figure 23-53 shows a spherical shell with uniform volume charge density $\rho = 1.84 \text{ nC/m}^3$, inner radius a = 10.0 cm, and outer radius b = 2.00a. What is the magnitude of the electric field at radial distances (a) r = 0; (b) r = a/2.00, (c) r = a, (d) r = 1.50a, (e) r = b, and (f) r = 3.00b?

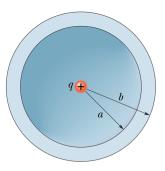

Fig. 23-52 Problem 51.

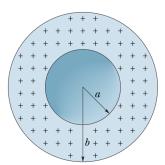

Fig. 23-53 Problem 52.

Electric Potential

4 Figure 24-24 gives the electric V potential V as a function of x. (a) Rank the five regions according to the magnitude of the x component of the electric field within them, greatest first. What is the direction of the field along the x axis in (b) region 2 and (c) region 4?

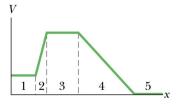

Fig. 24-24 Question 4.

••17 •• In Fig. 24-33, what is the net electric potential at point P due to the four particles if V = 0 at infinity, q = 5.00 fC, and d = 4.00 cm?

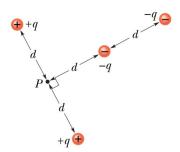

Fig. 24-33 Problem 17.
